# Robot Perception: Pose from Projective Transformations

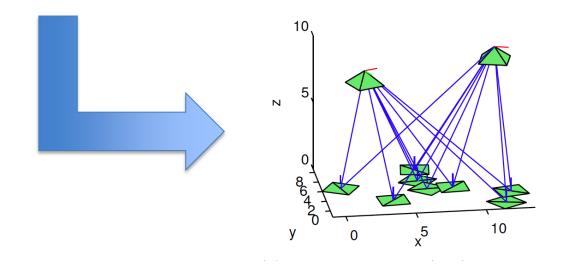

Kostas Daniilidis

## Using the projective transformation the pose of a robot with respect to a planar pattern:

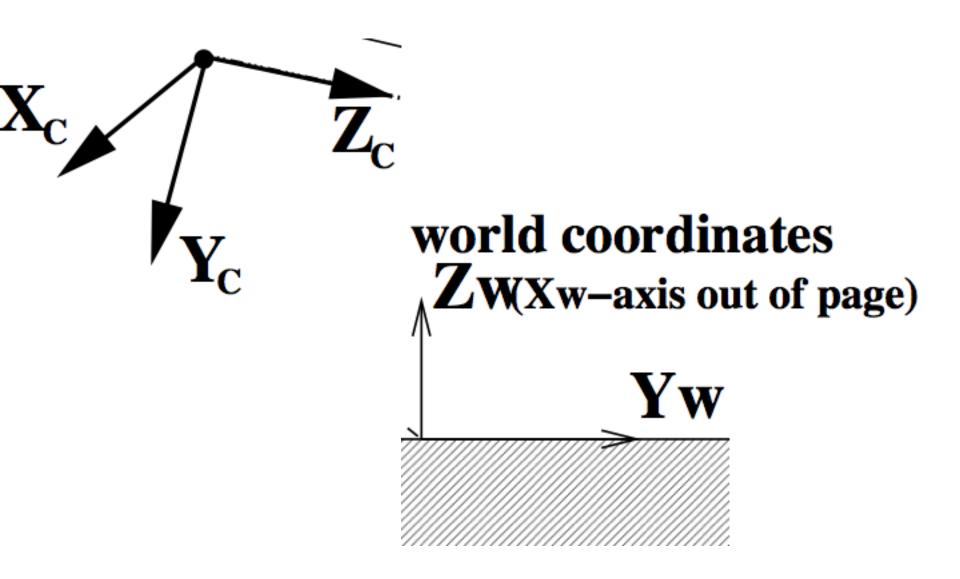

### Pose from reference points on plane $Z_w=0$

#### Pose from Projective Transformation

Recall the projection from world to camera

$$\begin{pmatrix} u \\ v \\ w \end{pmatrix} \sim K \begin{pmatrix} r_1 & r_2 & r_3 & T \end{pmatrix} \begin{pmatrix} X \\ Y \\ Z \\ W \end{pmatrix}$$

and assume that all points in the world lie in the ground plane Z=0.

Then the transformation reads

$$\begin{pmatrix} u \\ v \\ w \end{pmatrix} \sim K \begin{pmatrix} r_1 & r_2 & T \end{pmatrix} \begin{pmatrix} X \\ Y \\ W \end{pmatrix}$$

#### **Pose from Projective Transformation**

Recall the projection from world to camera

$$\begin{pmatrix} u \\ v \\ w \end{pmatrix} \sim K \begin{pmatrix} r_1 & r_2 & r_3 & T \end{pmatrix} \begin{pmatrix} X \\ Y \\ Z \\ W \end{pmatrix}$$

and assume that all points in the world lie in the ground plane Z=0.

Then the transformation reads

$$\begin{pmatrix} u \\ v \\ w \end{pmatrix} \sim K \begin{pmatrix} r_1 & r_2 & T \end{pmatrix} \begin{pmatrix} X \\ Y \\ W \end{pmatrix}$$

H is a transformation from  $\mathbb{P}^2$  to  $\mathbb{P}^2$ :

$$H \sim K \begin{pmatrix} r_1 & r_2 & T \end{pmatrix}$$

Is it a projective transformation? Let us inspect its determinant:

$$\detegin{pmatrix} r_1 & r_2 & T \end{pmatrix} = T^T(r_1 imes r_2)$$

which vanishes only if the camera lies in the ground plane Z=0. In this case all points would project on a line.

Since  $det(K) = f^2$ , H is invertible iff

$$T^T(r_1 \times r_2) \neq 0$$

H is a transformation from  $\mathbb{P}^2$  to  $\mathbb{P}^2$ :

$$H \sim K \begin{pmatrix} r_1 & r_2 & T \end{pmatrix}$$

Is it a projective transformation? Let us inspect its determinant:

$$\detig(r_1 \quad r_2 \quad Tig) = T^T(r_1 imes r_2)$$

which vanishes only if the camera lies in the ground plane Z=0. In this case all points would project on a line.

Since  $det(K) = f^2$ , H is invertible iff

$$T^T(r_1 \times r_2) \neq 0$$

H is a transformation from  $\mathbb{P}^2$  to  $\mathbb{P}^2$ :

$$H \sim K \begin{pmatrix} r_1 & r_2 & T \end{pmatrix}$$

Is it a projective transformation? Let us inspect its determinant:

$$\detegin{pmatrix} r_1 & r_2 & T \end{pmatrix} = T^T(r_1 imes r_2)$$

which vanishes only if the camera lies in the ground plane Z=0. In this case all points would project on a line.

Since  $det(K) = f^2$ , H is invertible iff

$$T^T(r_1 \times r_2) \neq 0$$

Suppose we estimate an H from  $N \geq 4$  correspondences.

Let us assume that we know the intrinsic parameters K.

Pose estimation means finding R,T given H and intrinsics K.

We observe that

$$K^{-1}H = \begin{pmatrix} r_1 & r_2 & T \end{pmatrix}$$

has specific properties: its first two columns are orthogonal unit vectors.

Nothing guarantees that that the  ${\cal H}$  we computed will satisfy this condition.

Suppose we estimate an H from  $N \geq 4$  correspondences.

Let us assume that we know the intrinsic parameters K.

Pose estimation means finding R,T given H and intrinsics K.

We observe that

$$K^{-1}H = \begin{pmatrix} r_1 & r_2 & T \end{pmatrix}$$

has specific properties: its first two columns are orthogonal unit vectors.

Nothing guarantees that that the  ${\cal H}$  we computed will satisfy this condition.

Suppose we estimate an H from  $N \geq 4$  correspondences.

Let us assume that we know the intrinsic parameters K.

Pose estimation means finding R, T given H and intrinsics K.

We observe that

$$K^{-1}H = \begin{pmatrix} r_1 & r_2 & T \end{pmatrix}$$

has specific properties: its first two columns are orthogonal unit vectors.

Nothing guarantees that that the  ${\cal H}$  we computed will satisfy this condition.

Let us name the columns of  $K^{-1}H$ :

$$K^{-1}H = \begin{pmatrix} h_1' & h_2' & h_3' \end{pmatrix}$$

We seek orthogonal  $r_1$  and  $r_2$  that are the closest to  $h'_1$  and  $h'_2$ . The solution to this problem is given by the Singular Value Decomposition.

We find the orthogonal matrix R that is the closest to  $\begin{pmatrix} h_1' & h_2' & h_1' \times h_2' \end{pmatrix}$ :  $\arg\min \|R - \begin{pmatrix} h_1' & h_2' & h_1' \times h_2' \end{pmatrix}\|_F^2$ 

$$\underset{R \in SO(3)}{\operatorname{arg\,min}} \|R - \begin{pmatrix} h'_1 & h'_2 & h'_1 \times h'_2 \end{pmatrix}\|_F^2$$

Let us name the columns of  $K^{-1}H$ :

$$K^{-1}H = \begin{pmatrix} h_1' & h_2' & h_3' \end{pmatrix}$$

We seek orthogonal  $r_1$  and  $r_2$  that are the closest to  $h'_1$  and  $h'_2$ . The solution to this problem is given by the Singular Value Decomposition.

We find the orthogonal matrix R that is the closest to  $\begin{pmatrix} h_1' & h_2' & h_1' imes h_2' \end{pmatrix}$ :

$$\underset{R \in SO(3)}{\operatorname{arg\,min}} \|R - \begin{pmatrix} h'_1 & h'_2 & h'_1 \times h'_2 \end{pmatrix}\|_F^2$$

$$\underset{R \in SO(3)}{\operatorname{arg\,min}} \|R - \begin{pmatrix} h'_1 & h'_2 & h'_1 \times h'_2 \end{pmatrix}\|_F^2$$

$$\begin{pmatrix} h_1' & h_2' & h_1' \times h_2' \end{pmatrix} = USV^T$$

then the solution is

$$R = U \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & \det(UV^T) \end{pmatrix} V^T$$

The diagonal matrix is inserted to guarantee that det(R) = 1.

$$\underset{R \in SO(3)}{\operatorname{arg\,min}} \|R - \begin{pmatrix} h'_1 & h'_2 & h'_1 \times h'_2 \end{pmatrix}\|_F^2$$

$$\begin{pmatrix} h_1' & h_2' & h_1' \times h_2' \end{pmatrix} = USV^T$$

then the solution is

$$R = U \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & \det(UV^T) \end{pmatrix} V^T$$

The diagonal matrix is inserted to guarantee that det(R) = 1.

$$\underset{R \in SO(3)}{\operatorname{arg\,min}} \|R - \begin{pmatrix} h'_1 & h'_2 & h'_1 \times h'_2 \end{pmatrix}\|_F^2$$

$$\begin{pmatrix} h_1' & h_2' & h_1' \times h_2' \end{pmatrix} = USV^T$$

then the solution is

$$R = U \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & \det(UV^T) \end{pmatrix} V^T$$

The diagonal matrix is inserted to guarantee that det(R) = 1.

$$\underset{R \in SO(3)}{\operatorname{arg\,min}} \|R - \begin{pmatrix} h'_1 & h'_2 & h'_1 \times h'_2 \end{pmatrix}\|_F^2$$

$$\begin{pmatrix} h_1' & h_2' & h_1' \times h_2' \end{pmatrix} = USV^T$$

then the solution is

$$R = U \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & \det(UV^T) \end{pmatrix} V^T$$

The diagonal matrix is inserted to guarantee that det(R) = 1.
